Education

- **Vishwakarma Institute of Information Technology** — Pune, India
  Bachelor of Technology in Information Technology; CGPA: 9.08 — *Aug. 2018 – July. 2022*

Experience

- **Amazon Web Services - Aurora Storage Control Plane & Global DB** — Bangalore, India
  Software Development Engineer 2 — *Jul 2022 - Present*
  - **Technologies Used**: AWS Aurora, AWS DynamoDB, Java, C / C++, SQL, Bash, Design Principles
  - **Overview**: Amazon Aurora is a relational database service with high performance and availability at global scale. As a part of the Global DB team, I worked on the infrastructure that supports replicating data from one AWS region to another, for disaster recover, higher availability and scalibility. As part of the Control Plane team, i worked on the deployments and security aspect of the fleet. Some of the projects I worked on are :
  - **Dynamic Deployment Service endpoint support for OS patching**: Created a feature in service discovery logic and deployment microservice to use multiple upstream deployment server instances hosting repositories instead of a single instance. This improved os patching deployment resiliency by 30%

  Software Development Engineer 1 — *Jul 2022 – Aug 2024*
  - **GlobalDb Deployment Autoscaling Feature**: This feature enabled the GlobalDb fleet to autoscale for deployments dynamically as per customer maintenance window and instead of static configs. By making changes to the Aurora Storage autoscaler, deployment processor and deployment microservice, this feature removes the need for manual intervention during GlobalDb deployments, saves around 180k$ per deployment and reduces WW deployment time from 2 months to 3 weeks.
  - **GlobalDb fleet migration feature**: I created a feature in GlobalDb work assignment microservice to prioritise different instance types based on a DynamoDb record instead of assigning work randomly. This feature enabled efficiently migrating the internal GlobalDb fleet of around 40k instances from x86_64 to aarch64 which are around 40% cheaper without any manual intervention and without any additional unavailability.
- **Shiprocket - ICRM team** — Remote
  Software Engineer Intern — *Feb 2022 - Jun 2022*
  - **Technologies used**: AWS Lambda, AWS DynamoDB, AWS S3, PHP, Laravel, MySQL, REST APIs, SQL using ORM, Data Structures
  - **Overview**: Shiprocket is a shipping aggregator company and is India's biggest eCommerce shipping solution. As a part of the ICRM (Internal Customer Relationship Management team), I worked on building a highly scalable OCR service using AWS lambda which reads around 40,000 courier images daily. This data is stored in DynamoDB. Also built a cron job which fetches the data every 24 hours and mails it to shareholders. This has reduced user generated discrepancies by over 80%.

Achievements

- **Star Award - Aurora Storage** : Received Star Award at AWS Aurora storage Q3 2023 all hands meet for displaying exceptional Bias for Action Amazon leadership principle.
- **Winner of CodeX 2020**: Secured first prize in CodeX 2020, a coding competition for undergrad students hosted by CSI Pune with over 250 applicants. *Certificate*

Positions of Responsibility

- **President - CodeChef Campus Chapter** : President of CodeChef College Chapter VIIT 2020-2021 with a community of over 140 students. *Certificate*
